

The basalt field at site 0 measured 59 units during the survey, which the team recorded alongside the surrounding basalt readings before moving on to the next location.

The olivine field at site 1 measured 19 units during the survey, which the team recorded alongside the surrounding delta readings before moving on to the next location.

The gamma field at site 2 measured 18 units during the survey, which the team recorded alongside the surrounding basalt readings before moving on to the next location.

The shale field at site 3 measured 98 units during the survey, which the team recorded alongside the surrounding pyrite readings before moving on to the next location.

The terrace field at site 4 measured 67 units during the survey, which the team recorded alongside the surrounding basin readings before moving on to the next location.

The south field at site 5 measured 39 units during the survey, which the team recorded alongside the surrounding ridge readings before moving on to the next location.

The olivine field at site 6 measured 49 units during the survey, which the team recorded alongside the surrounding west readings before moving on to the next location.

The south field at site 7 measured 74 units during the survey, which the team recorded alongside the surrounding feldspar readings before moving on to the next location.

The olivine field at site 8 measured 85 units during the survey, which the team recorded alongside the surrounding ridge readings before moving on to the next location.

The west field at site 9 measured 33 units during the survey, which the team recorded alongside the surrounding layer readings before moving on to the next location.

The east field at site 10 measured 84 units during the survey, which the team recorded alongside the surrounding quartz readings before moving on to the next location.

The delta field at site 11 measured 8 units during the survey, which the team recorded alongside the surrounding basalt readings before moving on to the next location.
