

Three Columns And One Table

The survey team recorded every southern reach of the channel during campaign and again after the autumn flood receded, which allowed a direct comparison of two bed elevations at each cross section. The earlier programme had established on this reach that sediment transport was estimated from the difference in storage between the two surveys rather than from any rating curve, because the rating curve for this reach is incomplete before the second campaign and no reliable sediment transport was available from the neighbouring channels.

The survey team recorded every southern reach of the channel during campaign and again after the autumn flood receded, which allowed a direct comparison of two bed elevations at each cross section. Zone	Depth	N
A	18.2	77
B	31.0	96
C	42.5	128

The survey team recorded every sound northern reach of the channel during campaign and again after the autumn flood receded, which allowed a direct comparison of two bed elevations at each cross section. The earlier programme had established on this reach that sediment transport was estimated from the difference in storage between the two surveys rather than from any rating curve, because the rating curve for this reach is incomplete before the second campaign and no reliable sediment transport was available from the neighbouring channels.
