

Basalt	A dark fine-grained volcanic rock that forms from the rapid cooling of magnesium-rich lava exposed at the surface of the crust.
Granite	A coarse-grained intrusive igneous rock composed mainly of quartz and feldspar that crystallises slowly deep below the ground.
Shale	A fine-grained sedimentary rock formed from the compaction of silt and clay particles over very long geological periods of time.
Quartz	A hard crystalline mineral made of silicon dioxide that is found widely across many different rock types and mineral veins worldwide.
