

The basalt field at site 0 measured 60 units during the survey, which the team recorded alongside the surrounding zone readings before moving on to the next location.

The unit field at site 1 measured 77 units during the survey, which the team recorded alongside the surrounding west readings before moving on to the next location.

The pyrite field at site 2 measured 79 units during the survey, which the team recorded alongside the surrounding zone readings before moving on to the next location.

The feldspar field at site 3 measured 71 units during the survey, which the team recorded alongside the surrounding pyrite readings before moving on to the next location.

The granite field at site 4 measured 96 units during the survey, which the team recorded alongside the surrounding calcite readings before moving on to the next location.

The pyrite field at site 5 measured 34 units during the survey, which the team recorded alongside the surrounding north readings before moving on to the next location.

The south field at site 6 measured 99 units during the survey, which the team recorded alongside the surrounding zone readings before moving on to the next location.

The calcite field at site 7 measured 81 units during the survey, which the team recorded alongside the surrounding north readings before moving on to the next location.

The south field at site 8 measured 57 units during the survey, which the team recorded alongside the surrounding gamma readings before moving on to the next location.

The east field at site 9 measured 31 units during the survey, which the team recorded alongside the surrounding south readings before moving on to the next location.

The west field at site 10 measured 41 units during the survey, which the team recorded alongside the surrounding unit readings before moving on to the next location.

The gamma field at site 11 measured 18 units during the survey, which the team recorded alongside the surrounding basalt readings before moving on to the next location.
